

Sampling Tolerances

Care needs to be taken because not all differences are significant and may be due to chance because not all the population was sampled. The tables below show the degree of uncertainty on the values given at the 95% confidence interval for a single population and a comparison of two groups.

For example, for a question with 90% satisfied and 10% dissatisfied for 2447 respondents, we would expect the true proportion satisfied to be between 89% and 91%, 19 times in 20. A comparison between two districts with 200 respondents each would need a difference of at least 10% to be significant, if the statistic was near 30 or 70%.
